

Nederlab

progress and challenges in linguistic
enrichment of historical Dutch texts

Katrien Depuydt, Maarten van Gompel, Jesse de Does,
Hennie Brugman, Gosse Bouma

Outline

- Project and corpus
- The current tagging pipeline
 - “Modernization” procedure
 - Linguistic enrichment
 - Metadata
- Evaluation
 - Principles
 - Preparation of ground truth
- Conclusions and future work

Nederlab: Project and corpus

The project

- “NWO groot”, from 1-1-2013 until mid 2018
- Research environment aimed primarily at historians, linguists and literary scholars
- Bring together existing digital text collections
- Diachronic corpus: from year ~800 until present
- Uniform, curated and enriched metadata and texts

Linguistic annotation

- Processing depends on
 - language period
 - availability of gold standard material
- Research: Modernisation before linguistic annotation with Frog
- Evaluation
- PoS and modern Dutch equivalent

Current tagging pipeline

- It is not feasible to produce training data for all varieties in the corpus
 - Requires lots of training data
 - Sensitive to language variation

So far: two pathways:

- Historical text → “Modernized” text → Modern tagger/lemmatizer (Frog)
- Contemporary only (Frog)

- Use **period metadata** to determine what path to follow

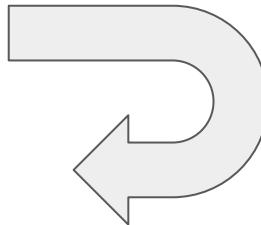

- Corpus delivered in **FoLiA XML** (huge!!), to be indexed for actual use in the Nederlab portal using MTAS’ Indexer

Implemented as part of PICCL (<https://github.com/LanguageMachines/PICCL>), powered by Nextflow (<https://nextflow.io>)

“Modernization”

What does this actually mean??

- “Translation” to modern Dutch (MT)
 - wyf → vrouw
 - wyven → vrouwen
- “Transverbation”
 - wyf → wijf
 - wyven → wijven
- “Modern lemmatization”
 - wyf → wijf N(ev)
 - wyven → wijf N(mv)

Modernisation: Current procedure

- Modernisation of 17th century Dutch and 18th century Dutch
- Word-by-word ‘translation’ trained on:
 - Extracted lexicon from Statenbijbels (parallel corpus 1637 vs 1888)
 - Extracted substitution rules
 - Word-by-word translations are inherently limited !!
 - Can’t deal with contractions, split words, etc..
- Tjong Kim Sang (2016); *Improving Part-of-Speech Tagging of Historical Text by First Translating to Modern Text*
- Reimplemented in FoLiA-wordtranslate (part of <https://github.com/LanguageMachines/foliautils>)

Linguistic Enrichment

- **Frog:** Part-of-Speech tagging, Lemmatisation & Named Entity Recognition
 - Supervised machine learning (memory-based learning)
 - Trained on large corpora of contemporary dutch
 - Part-of-Speech: CGN tagset
 - <https://languagemachines.github.io/frog>
- Lemma linking to INT Historical Lexicon
- Entity linking with **FoliaEntity**
 - Links found entities to external resources (e.g DBpedia)
 - <https://github.com/ErwinKomen/FoliaEntity>

Gentse Spelen (1539)

http://www.dbl.org/tekst/_gen001gent01_01/

| | PoS | Lemma |
|--|-------|-------|
| Frog as is: | 37.6% | 31% |
| With modernization: | 52.7% | 53.7% |
| Retrained Frog (on Letters as Loot) | 54.3% | 45.3% |

(choose the right training material!)

Metadata (2)

- Book vs. Text
 - Date witness vs. date text
 - Editorial matter v.s. original text
 - Several texts with several authors, dates, etc. in one publication
-
- Searching
 - Linguistic analysis
 - Tagging strategy!

Evaluation tagset (1)

- CGN tagset is starting point
- Full CGN tagset (i.e. with features) too detailed to be feasible
- Problems in applying it to historical Dutch
 - Principle tag + lemma ⇒ (almost) determines word form cannot be maintained historically
 - (likewise for CG/CRM): tagging inflection instead of case/number/mood/tense etc does not benefit (diachronic) analysis
 - Mood cannot be lumped with tense historically (PVTIJD = tegenwoordig, verleden, imperatief, conjunctief.)
 - “dial” for all non-standard-modern words is unsatisfactory

Evaluation tagset (2)

- Just main part of speech is not enough
 - Mapping problems (lexical vs. functional tagging)
 - extra features: enable mapping POS / differences in lemmatisation
 - WW(vd,prenom) → ADJ, lemma: *gebroken*
 - WW(vd,vrij) → VRB, lemma: *breken*
 - Too much detail lost

Evaluation tagset (3)

- Intermediate option
 - Keep “position” information
 - Keep pronoun types and some other important distinctions
- Taking to account mappability to other tagsets
 - Functional tagging of main part of speech (as in e.g. CHN, Corpus Gysseling, Brieven als buit)
 - Universal dependencies

Evaluation tagset (4)

Lemma error types / interpretation differences

Subtleties

Sellery ?sellerie ?selderij

Remnants of the MT approach:

beest → dier

gezicht → visioen

vel → huid

But mostly unrecognized or wrongly resolved variants

Conclusions

- Modernization works in 18th century
 - But it should be possible to improve on current modernization by optimising the modernization lexicon
 - and by consistently choosing for “transverbation” to obtain correct lemmata
- Normalisation of some form is needed for ca.1800-1954
 - But different training data for modernization required
- Enriching thousands of documents is computationally very expensive

Future work

- Evaluation sets for other language periods
- Training Frog with existing gold standards
 - Brieven als buit > Sailing letters
 - Gentse spelen > 16th Century material
 - CG and CRM > Middle Dutch and 16th Century material
- Evaluation measures more detailed
- Related projects
